

Making the railway system
work better for society.

Guide for the application of the NOI TSI

In accordance with Article 19(3) of Regulation (EU) 2016/796 of the European Parliament and of the Council of 11 May 2016

Released by European Union Agency for Railways

This guide does not contain any legally binding advice. It may serve as a clarification tool without however dictating in any manner compulsory procedures to be followed and without establishing any legally binding practice. The guide provides explanations on the provisions contained in the TSIs and should be helpful for understanding the approaches and rules described therein. However, it does not substitute for them.

The guide is publicly available and it will be regularly updated to reflect progress with European standards and changes to the TSIs.

The reader should refer to the website of the European Union Agency for Railways for information about its latest available edition.

1. SCOPE OF THIS GUIDE

This document provides information on the application of Commission Regulation (EU) No 1304/2014 of 26 November 2014 on the technical specification for interoperability relating to the subsystem ‘rolling stock — noise’ amending Decision 2008/232/EC and repealing Decision 2011/229/EU as amended by Commission Implementing Regulation (EU) 2019/774 (hereinafter referred to as the ‘NOI TSI’).

The guide should be read and used only in conjunction with the NOI TSI. It is intended to facilitate its application, but does not replace it.

1.1. Content of the guide

In the following chapters of this document, extracts of the text of the NOI TSI are provided in shaded text boxes, which are followed by a text that gives guidance.

Guidance is not provided for clauses where the NOI TSI requires no further explanation.

Guidance is of voluntary application. It does not mandate any requirement in addition to those set out in the NOI TSI.

Guidance is given by means of further explanatory text and, where relevant, by reference to standards that demonstrate compliance with the NOI TSI. Relevant standards are listed in appendix 1 of this document, and their purpose is indicated in the column ‘Purpose’ of the table.

1.2. Document reference/s

1.3. Definitions and abbreviations

Table 2: Definitions

<i>TERM</i>	<i>DEFINITION/ SOURCE</i>
Acts issued by the Agency	Are those listed in Article 4 of Regulation (EU) 2016/796 of the European Parliament and of the Council (Agency Regulation)
Basic parameter	Any regulatory, technical or operational condition which is critical to interoperability and is specified in the relevant TSIs (Article 2(12) of Directive (EU) 2016/797)

Table 2: Definitions

<i>TERM</i>	<i>DEFINITION/ SOURCE</i>
Conformity assessment	Process demonstrating whether specified requirements relating to a product, process, service, subsystem, person or body have been fulfilled (Article 2(41) of Directive (EU) 2016/797)
Conformity assessment body	Body that has been notified or designated to be responsible for conformity assessment activities, including calibration, testing, certification and inspection; a conformity assessment body is classified as a 'notified body' following notification by a Member State; a conformity assessment body is classified as a 'designated body' following designation by a Member State (Article 2(42) of Directive (EU) 2016/797)
Contracting entity	Public or private entity which orders the design and/or construction or the renewal or upgrading of a subsystem (Article 2(20) of Directive (EU) 2016/797)
European Register of Authorised Types of Vehicles (ERATV)	Register of types of vehicles authorised by the Member States for placing in service. It contains the technical characteristics of vehicles' types as defined in the relevant TSIs, the manufacturer's name, dates, references and Member States granting authorisations, restrictions and withdrawals (Article 48 of Directive (EU) 2016/797)
Existing rail system	Infrastructure composed of lines and fixed installations of the existing, rail network as well as the vehicles of all categories and origin travelling on that infrastructure (Article 2(16) of Directive (EU) 2016/797)
Harmonised standard	European standard adopted on the basis of a request made by the Commission for the application of Union harmonising legislation (Article 2(1)(c) of Regulation (EU) No 1025/2012)
Infrastructure Manager	Anybody or firm responsible for the operation, maintenance and renewal of railway infrastructure on a network, as well as responsible for participating in its development as determined by the Member State within the framework of its general policy on development and financing of infrastructure (Article 3(2) of Directive 2012/34/EU)
Non-application of a TSI	Certain circumstance, by which projects can be exempted from having to comply with all or part of a TSI or TSIs (Article 7 of Directive (EU) 2016/797)
Open point	Certain technical aspect corresponding to the essential requirements, which cannot be explicitly covered in a TSI (Article 4(6) of Directive (EU) 2016/797)
Placing in service	All the operations by which a subsystem is put into its operational service (Article 2(19) of Directive (EU) 2016/797)
Placing on the market	First making available on the Union's market of an interoperability constituent, subsystem or vehicle ready to function in its design operating state (Article 2(35) of Directive (EU) 2016/797)
Project at an advanced stage of development	Any project the planning or construction stage of which has reached a point where a change in the technical specifications may compromise the viability of the project as planned (Article 2(23) of Directive (EU) 2016/797)

Table 2: Definitions

<i>TERM</i>	<i>DEFINITION/ SOURCE</i>
Railway Undertaking	Railway undertaking as defined in point (1) of Article 3 of Directive 2012/34/EU, and any other public or private undertaking, the activity of which is to provide transport of goods and/or passengers by rail on the basis that the undertaking is to ensure traction; this also includes undertakings which provide traction only (Article 2(45) of Directive (EU) 2016/797)
Register of infrastructure (RINF)	Register of infrastructure indicates the main features of fixed installations, covered by the subsystems: infrastructure, energy and parts of control-command and signalling. It publishes performance and technical characteristics mainly related to interfaces with rolling stock and operation (Article 49 of Directive (EU) 2016/797)
Renewal	Any major substitution work on a subsystem or part of it, which does not change the overall performance of the subsystem (Article 2(15) of Directive (EU) 2016/797)
Specific case	Any part of the rail system which needs special provisions in the TSIs, either permanent, because of geographical, topographical or urban environment constraints or those affecting compatibility with the existing system, in particular railway lines and networks isolated from the rest of the Union, the loading gauge, the track gauge or space between the tracks and vehicles strictly intended for local, regional or historical use, as well as vehicles originating from or destined for third countries (Article 2(13) of Directive (EU) 2016/797)
Substitution in the framework of maintenance	Any replacement of components by parts of identical function and performance in the framework of preventive or corrective maintenance (Article 2(17) of Directive (EU) 2016/797)
Upgrading	Any major modification work on a subsystem or part of it which results in a change in the technical file accompanying the 'EC' declaration of verification, if that technical file exists, and which improves the overall performance of the subsystem (Article 2(14) of Directive (EU) 2016/797)

2. GUIDANCE ON THE APPLICATION OF THE NOI TSI

2.1. Introduction

Point 1.1.1: Scope related to rolling stock

This TSI applies to all rolling stock within the scope of Regulation (EU) No 1302/2014 (LOC&PAS TSI) and Regulation (EU) No 321/2013 (WAG TSI);

The NOI TSI does not apply to wagons designed to operate only on the 1 520 mm network and the application of the NOI TSI for mobile railway infrastructure construction and maintenance equipment as defined in chapter 2 bullet (c) of the NOI TSI is voluntary.

Section 1.2: Geographical scope

The geographical scope of this TSI corresponds to the scopes defined in Section 1.2 of Regulation (EU) No 1302/2014 and in Section 1.2 of Regulation (EU) No 321/2013, each for their rolling stock (RST) concerned.

The geographical scope of the NOI TSI includes the entire European Union's rail system as set out in Annex I of Directive (EU) 2016/797. The reference to the LOC&PAS TSI and the WAG TSI makes sure that the same restrictions affecting the rolling stock are taken over by the NOI TSI.

2.2. Essential requirements

All basic parameters set out in this TSI shall be linked to at least one of the essential requirements as set out in Annex III of Directive (EU) 2016/797. Table 1 indicates the allocation.

The basic parameters harmonised in TSIs must be critical to interoperability and linked with at least one of the essential requirements set out in Annex III of Directive (EU) 2016/797. The basic parameters of the NOI TSI are all linked with the essential requirement 1.4.4.

Additional rolling stock measures are not needed in order to comply with neither Directive 2002/49/EC nor Directive 2003/10/EC.

2.3. Characterisation of the subsystem

Point 4.2.3: Limits for pass-by noise

Measurements at speeds higher than or equal to 250 km/h shall also be made at the ‘additional measurement position’ with a height of 3,5 m above top of rail in accordance with Chapter 6 of EN ISO 3095:2013 and assessed against the applicable limit values of Table 4.

The distance from the centre of the track of the ‘additional measurement position’ is 7,5 m.

Table 4: Limit values for pass-by noise

<i>Category of the rolling stock subsystem</i>	<i>$L_{pAeq, Tp}$ (80 km/h) [dB]</i>	<i>$L_{pAeq, Tp}$ (250 km/h) [dB]</i>
<i>Wagons (normalised to APL = 0,225) (*)</i>	<i>83</i>	<i>n.a.</i>

The pass-by noise limit values set out in the NOI TSI assume certain conditions to guarantee that the noise emitted by the rolling stock under assessment is higher than the noise emitted by the track (e.g. roughness of the wheel, roughness of the rail, vertical and lateral track decay rates of the track). Considering the track, these conditions are not always found in daily operation. Therefore, it may be that e.g. wagons compliant with the pass-by noise requirements of the TSI (new or retrofitted with composite brake blocks) slightly exceed the pass-by noise limit values set out in the TSI in operation.

Section 4.4: Operating rules

Requirements concerning the operating rules for the subsystem rolling stock are set out in section 4.4 of the Annex of Regulation (EU) No 1302/2014 and in section 4.4 of the Annex of Regulation (EU) No 321/2013.

The applicant has the obligation to add in the technical file operating rules and requirements which ensure that during operation the noise emission remains within the permitted range of limit values of the NOI TSI under the conditions in which these limit values were assessed.

Section 4.5: Maintenance rules

Requirements concerning the maintenance rules for the subsystem rolling stock are set out in section 4.5 of the Annex of Regulation (EU) No 1302/2014 and in section 4.5 of the Annex of Regulation (EU) No 321/2013.

The applicant has the obligation to add in the technical file maintenance rules and requirements which ensure that the noise emission remains within the permitted range of limit values of the NOI TSI throughout the life cycle of the rolling stock under the conditions in which these limit values were assessed.

It is not required to repeat the assessment procedure as set out in chapter 6 of this TSI as part of the maintenance rules.

2.4. Conformity assessment and EC verification

Point 6.2.2.1: Stationary noise

For the assessment of the main air compressor noise at the nearest measuring position i , the $L_{pAeq,T}^i$ indicator shall be used with T representative of one operating cycle as defined in Section 5.7 of EN ISO 3095:2013. Only the train systems that are required for the air compressor to run under normal operating conditions shall be used for this. The train systems which are not needed for the operation of the compressor may be switched off to prevent contribution to the noise measurement. The demonstration of conformity with the limit values shall be carried out under the conditions solely necessary for operation of the main air compressor at the lowest rpm.

During this assessment process it is not mandatory to switch on any system powered by the compressor (e.g. toilet, secondary suspension, pneumatic door step, intercirculation pneumatic doors).

The cycle as defined in the last paragraph of section 5.7 of the EN ISO 3095:2013 does not include the silent period between the shut-down of the compressor and the successive start-up.

When measuring the noise emitted by the main air compressor and the exhaust valve of the air dryer the 'nearest position' of the mesh set out in clause 5.5.1.1 of EN ISO 3095:2013 is assumed to be the noisiest one. In case of doubt it may be necessary to measure more than one position in the mesh e.g. on both sides of the rolling stock.

Point 6.2.2.2: Starting noise

In addition the noise shall be measured at a distance of 7,5 m from the centre of the track and a height of 1,2 m above top of rail. The 'averaged level method' and the 'maximum level method' in accordance with Section 7.6 and 7.5 respectively of EN ISO 3095:2013 shall apply and the train shall accelerate from standstill up to 40 km/h and then maintain the speed. The measured values

are not assessed against any limit value and shall be recorded in the technical file and communicated to the Agency.

The positions alongside the vehicle should be those set out in point 7.5 of EN ISO 3095 for both the 'averaged level method' and the 'maximum level method'.

Point 6.2.2.3.2: Procedure

The tests shall be carried out in accordance with the provision in Sections 6.1, 6.3, 6.4, 6.5, 6.6 and 6.7 (without 6.7.2) of EN ISO 3095:2013.

If the unit under assessment is a locomotive, it is allowed to carry out the measurements at all test speeds with a tractive effort equal to at least two thirds of the maximum available value at maximum speed. This value can be deduced from calculated tractive effort versus speed curves.

Point 6.2.3: Simplified evaluation

Instead of the test procedures as set out in point 6.2.2, it is permitted to substitute some or all of the tests by a simplified evaluation. The simplified evaluation consists of acoustically comparing the unit under assessment to an existing type (further referred to as the reference type) with documented noise characteristics.

Before the simplified evaluation method can be applied, it should be established that the unit under assessment and the reference type are comparable in terms of design, operation and acoustic behaviour.

'Documented noise characteristics' means that the total sound emission as well as the acoustic behaviour of the single components that are contributing to it should be known and listed.

It should be explicitly declared whether a modification of one component has an impact on other noise sources.

The simplified evaluation may be used for each of the applicable basic parameters 'stationary noise', 'starting noise', 'pass-by noise' and 'driver's cab interior noise' autonomously and shall consist of providing evidence that the effects of the differences of the unit under assessment do not result in exceeding the limit values set out in Section 4.2.

For the units under simplified evaluation, the proof of conformity shall include a detailed description of the noise relevant changes compared to the reference type. From this description, a simplified evaluation shall be performed. The estimated noise values shall include the uncertainties of the applied evaluation method. The simplified evaluation can either be a calculation and/or simplified measurement.

Evidence should be robust and verifiable. The analysis should be repeatable with equal results. Calculations should be described in detail to enable the notified body to assess the quality of the calculation process. Assumptions should be made conservatively.

Additional guidance on the application of simplified evaluation methods is available in the deliverable 1.1 of the EU project ACOUTRAIN (contract n° FP7 – 284877) ‘Clarification of the simplified method in the partial revision of the TSI’ (ref. ACT-WP1-D-SNC-004-04 dated 10/10/2012). This document covers the following aspects:

- › Certified tools/calculation of uncertainties
- › Validation strategy
- › Definition of representative operating conditions (ROC)
- › Additional guidance to apply modifications related to:
 - › Number of axles
 - › Unit maximum speed
 - › Type of the wheels
 - › Braking system (that does not influence anything else, but the acoustic roughness of the wheel)
 - › Composition of the unit (stationary noise case)
 - › Composition of the unit (pass-by noise case)
 - › Selection of the noisiest configuration of different single vehicles
 - › Equipment configuration on board the vehicle (stationary/pass-by/starting noise cases)

In case of a wagon whose parameters remain, compared to the reference type, within the permitted range of Table 7 it is deemed without further verification that the unit complies with the limit values on pass-by noise as set out in point 4.2.3.

If e.g. a wagon under assessment is equipped with brake blocks listed in appendix G of the WAG TSI, it is assumed without further verification that such blocks do not result in higher pass-by noise emissions.

2.5. Implementation

Point 7.2.2: Additional provisions for the application of this TSI to existing wagons

The restriction of the operation set out in Article 5a of this Regulation shall not apply to wagons mostly operated on lines with a gradient of more than 40 ‰, wagons with a maximum operating speed higher than 120 km/h, wagons with a maximum axle load higher than 22,5 t, wagons exclusively operated for infrastructure works and wagons used in rescue trains.

Wagons exclusively operated for infrastructure works may refer to freight wagons or any hauled vehicle, part of an on-track machine or not, exclusively operated for infrastructure works.

Point 7.2.2.1: Quieter brake blocks

A quieter brake block is a brake block belonging to one of the following categories:

- Brake block listed in Appendix G of Regulation (EU) No 321/2013;

Brake blocks listed in appendix G of the WAG TSI should be used taking into consideration the ‘Usage guidelines for composite (LL) brake blocks’ (available on

https://uic.org/IMG/pdf/rili_II_10_edition2017_en.pdf) and ‘Design rules for composite brake blocks (K)’ (available on https://uic.org/IMG/pdf/rili_k_9_ausgabe_en.pdf).

2.6. Appendices of the NOI TSI

Appendix C: Assessment of the rolling stock subsystem

The table in Appendix C ‘Assessment of the rolling stock subsystem’ is to be understood as follows: During the application of the assessment procedures of point 6.2.2 only the type test shall be carried out. If the simplified evaluation in point 6.2.3 is applied the design review has to be done based on a type test of the reference unit.

Appendix D: Quieter routes

In accordance with Article 5c(1) of this Regulation the Member States shall provide the European Union Agency for Railways (‘the Agency’) with a list of quieter routes in a format allowing further processing by the users with IT-tools. The list shall contain at least the following information:

- *Start and end points of the quieter routes and their corresponding sections, using geographical code location as defined in the register set out in Commission Implementing Decision 2014/880/EU (*) (RINF). If one of these points is at the border of the Member State, it shall be reflected.*
- *Identification of the sections making up the quieter route*

The list shall be provided using the template below:

<i>Quieter route</i>	<i>Sections in the route</i>	<i>Unique section ID</i>	<i>Quieter route starts/finishes at the border of the Member State</i>
<i>Point A — Point E</i>	<i>Point A — Point B</i>	<i>201</i>	<i>Yes POINT E (Country Y)</i>
	<i>Point B — Point C</i>	<i>202</i>	
	<i>Point C — Point D</i>	<i>203</i>	
	<i>Point D — Point E</i>	<i>204</i>	
<i>Point F — Point I</i>	<i>Point F — Point G</i>	<i>501</i>	<i>No</i>
	<i>Point G — Point H</i>	<i>502</i>	
	<i>Point H — Point I</i>	<i>503</i>	

It is advised that Member States ask the infrastructure managers to make the first draft of the list and/or maps. The lines as drafted by the infrastructure manager should be taken into account for preparing the lists and illustrative maps depicting the quieter routes by the Member States.

All freight trains passing a certain point on the considered route should be taken into account regardless of direction of travel. It is allowed to combine sections of different lines which are side by side for the application of the threshold of 12 freight trains during night time.

The information on the average number of freight trains during night could be provided too on a voluntary basis so that the template looks like this:

Quieter route	Sections in the route	Unique section ID	Average number of freight trains during night	Quieter route starts/finishes at the border of the Member State
Point A — Point E	Point A — Point B	201	45	Yes POINT E (Country Y)
	Point B — Point C	202	45	
	Point C — Point D	203	20	
	Point D — Point E	204	19	
Point F — Point I	Point F — Point G	501	13	No
	Point G — Point H	502	40	
	Point H — Point I	503	15	

In addition, the Member States may provide maps illustrating the quieter routes on a voluntary basis.

If the Member States choose to additionally provide a map, then the following guidelines should be applied. The maps should:

- › Clearly identify whether a section is quieter or not
- › Be scalable so that after sufficiently zooming in a map remains legible and the individual sections distinguishable, by using a scalable format such as e.g. vector graphics
- › Contain section IDs
- › Contain names of the stations and/or operational points
- › Be provided in a generic file format

3. APPLICABLE SPECIFICATIONS AND STANDARDS

Annex 1 Voluntary standards

REFERENCE IN THE NOI TSI		VOLUNTARY STANDARD	
Element of the subsystem	Point	Standard reference	Purpose
Stationary noise	4.2.1		
Starting noise	4.2.2		
Pass-by noise	4.2.3		

<i>REFERENCE IN THE NOI TSI</i>		<i>VOLUNTARY STANDARD</i>	
<i>Element of the subsystem</i>	<i>Point</i>	<i>Standard reference</i>	<i>Purpose</i>
Driver's cab interior noise	4.2.4
